Summary

Site reliability and platform engineer with 7+ years building, running and automating production systems on AWS, Google Cloud and Azure with Kubernetes, Terraform and GitOps. I currently work on a real-time iGaming platform held to a **99.99% SLA** with **sub-100 ms latency** targets. Before that, at an application-security SaaS serving 4,000+ enterprise customers, I cut **MTTR by 40%** and **repeat incidents by 35%**. My work covers both reliability (SLAs, observability, alerting, incident response, postmortems) and delivery (CI/CD, reusable infrastructure as code, GitOps, self-managed HashiCorp platforms), mostly in always-on, regulated environments: iGaming, SOC 2 SaaS and healthcare data.

Skills

Reliability: SLA ownership, capacity planning, alert design, on-call and escalation, incident response and RCA, runbooks, blameless postmortems, MTTR tracking, chaos engineering

Observability: Groundcover (eBPF), Prometheus, Grafana, OpenTelemetry, Datadog, incident.io

Cloud and containers: AWS (EKS, RDS, RDS Proxy, S3), Google Cloud (GKE, BigQuery), Azure; Kubernetes, Docker, Helm, Nomad, Consul

Infrastructure as code: Terraform (reusable modules, remote state), Ansible, CloudFormation, Puppet

CI/CD and GitOps: GitHub Actions, Argo CD, Flux, Jenkins

Security and compliance: SOC 2 controls and audit evidence, HashiCorp Vault (secrets, access policy)

Data: PostgreSQL, MongoDB Atlas, Redis, Kafka, Spark, BigQuery

Programming: Python, Bash; Go (familiar)

AI operations: LLM-assisted alert triage and root-cause analysis with self-hosted models (Ollama)

Experience

Site Reliability Engineer, Eeze Software | Birkirkara, Malta — Jun 2025 – Present

Real-time iGaming platform with a 99.99% SLA and sub-100 ms latency targets.

- Own reliability for latency-critical Kubernetes workloads within a **99.99% SLA**, covering capacity planning, alerting, incident response and maintenance windows.
- Evaluated the observability estate, made the case to replace Jaeger, OpenSearch and standalone Grafana with a single eBPF platform (Groundcover) covering logs, metrics and traces, and delivered the migration, cutting observability overhead by **60%**.
- Standardised rollout with reusable Terraform modules and Ansible playbooks, including observability sensor deployment, so every environment is built the same way and every change is reviewable.
- Designed alert routing between Groundcover and incident.io so incidents reach the owning team with context, tightening detection and response.
- Led recovery of a production MongoDB incident in **under 30 minutes**, then put retention controls in place to stop it recurring.
- Diagnosed PostgreSQL connection exhaustion under EKS pod scaling and proposed an RDS Proxy / PgBouncer architecture to the product teams.

Site Reliability Engineer, Invicti Security — Sep 2024 – Jun 2025

Application-security SaaS serving 4,000+ enterprise customers on AWS, Azure and GCP.

- Cut mean time to recovery (MTTR) by **40%** by redesigning alerting, runbooks and on-call escalation.
- Introduced blameless postmortems with tracked follow-up actions, reducing repeat incidents by **35%**.
- Operated Kubernetes and Terraform-managed infrastructure across AWS, Azure and GCP.
- Supported SOC 2 controls and audit evidence for the production infrastructure.

Platform Engineer, Modl AI | Malta — Jan 2023 – Aug 2024

AI-driven game-testing platform.

- Ran a self-managed scheduling and service platform on Nomad, Consul and HashiCorp Vault, including secrets management and access policy.
- Automated build and deployment pipelines with GitHub Actions and Terraform, shortening the path from commit to production.

Senior DevOps Engineer, Planatech | Remote (Costa Rica) — Jan 2022 – Dec 2022

iGaming platform provider.

- Owned CI/CD pipelines and cloud infrastructure for iGaming services.
- Delivered Kubernetes workloads through GitOps with Argo CD and Flux, on infrastructure defined in Terraform.

Earlier roles, Nigeria — Oct 2018 – Dec 2021

- **Cloud Interactive Platforms** (Lagos, Mar – Dec 2021): built Jenkins and Kubernetes delivery and led the migration of source control from SVN to Git.
- **Nweafor Group** (Abuja, Jun – Dec 2020): led a Puppet configuration-management migration across the server estate.
- **eHealth for Everyone** (Abuja, Oct 2019 – Dec 2020): built healthcare data pipelines with Spark, Kafka and BigQuery on Google Cloud.
- **Penguin Digitals** (Oct 2018 – Oct 2019): ran AWS infrastructure, Jenkins pipelines and MongoDB Atlas.

Projects and writing

- **Cognita, AI-assisted SRE platform** (personal project): designed and built a 10-module platform that uses LLMs for automated alert triage, root-cause analysis and postmortem tracking. It connects Kubernetes, Prometheus, Groundcover, incident.io, Jira and Slack to self-hosted LLMs (Ollama).
- **Technical writing:** published an article on delivering Airflow DAGs to Kubernetes through an S3-sync sidecar, a reusable pattern that removes image rebuilds for DAG changes.

Education, certifications and languages

- **BSc, University of Lagos**, 2013 – 2017
- **In progress:** Certified Kubernetes Administrator (CKA); AWS Certified Solutions Architect – Professional
- **Languages:** English (native), Yoruba (C2), German (A1), Maltese (learning)
